

Business Problem

Healthcare insurance companies process a large number of claims every day. Some claims may have unusual patterns or potential fraud, which can lead to unnecessary payments and financial losses. The business needs to analyze claims data to understand payment patterns, identify providers and claim types with higher fraud exposure, and prioritize high-value claims for further investigation.

Objective

Analyze → Identify → Prioritize

- **Analyze** overall claims and payment performance.
- **Identify** fraud patterns across providers, specialties, insurance and visit types.
- **Prioritize** high-value fraudulent claims and providers for further investigation.
